How the neutrino got its spots

Maximilian Weinhold

November 2025

0.1 This scientist had been blinded to K-theory so went in with categories, when all that was needed was a support.

$k \to support(i) \to k \to support(i+1) \cdots$ for support structure like the Yang-Mills action and unlocking $0k = k = 0$ as a related composible.

0.2 A grand theory of operators

$$o * \psi$$

$$o(a\psi)$$

$$(oa - ao)\psi$$

$$rt(\dots o(o(o(a * a))$$

For a runtime rt limit.

0.3 A hope for a pilgrim's program

Welcome.

1. a kindness of sense.
2. For the logical consideration
3. And a guarantee of $-S = log(t)$, or, assurances on space.
4. The probability notion. $B(/\eta)$
5. A guarantee of Ψ, being nonexistent.
6. A puncta of G and $\hbar$. Or whatever you wish to raise.
7. And a splitting, of course.
8. Where is the metric under the Planck interval?

1 a kindness of sense

2 For the logical consideration

3 And a first guarantee

4 With probability, give

5 And the other uninvariant guarantee

6 Puncta pop

7 Splits

8 Somewhere a metric (un)lurks
